Welcome to CURSED SOCIALS

A Hack Club YSWS where you clone a social media site's design, then add at least one feature that is hilariously, deliberately wrong. You ship it → you get a $5–$10 Hack Club grant.

What is a "Social"?

Instagram. TikTok. Twitter. YouTube. Any site where people post, scroll, and interact.

What is "Cursed"?

Deliberately broken. Intentionally chaotic. It works, but it shouldn't. The vibe: "what if a developer had too much coffee and no supervision."

What we'll explore today:

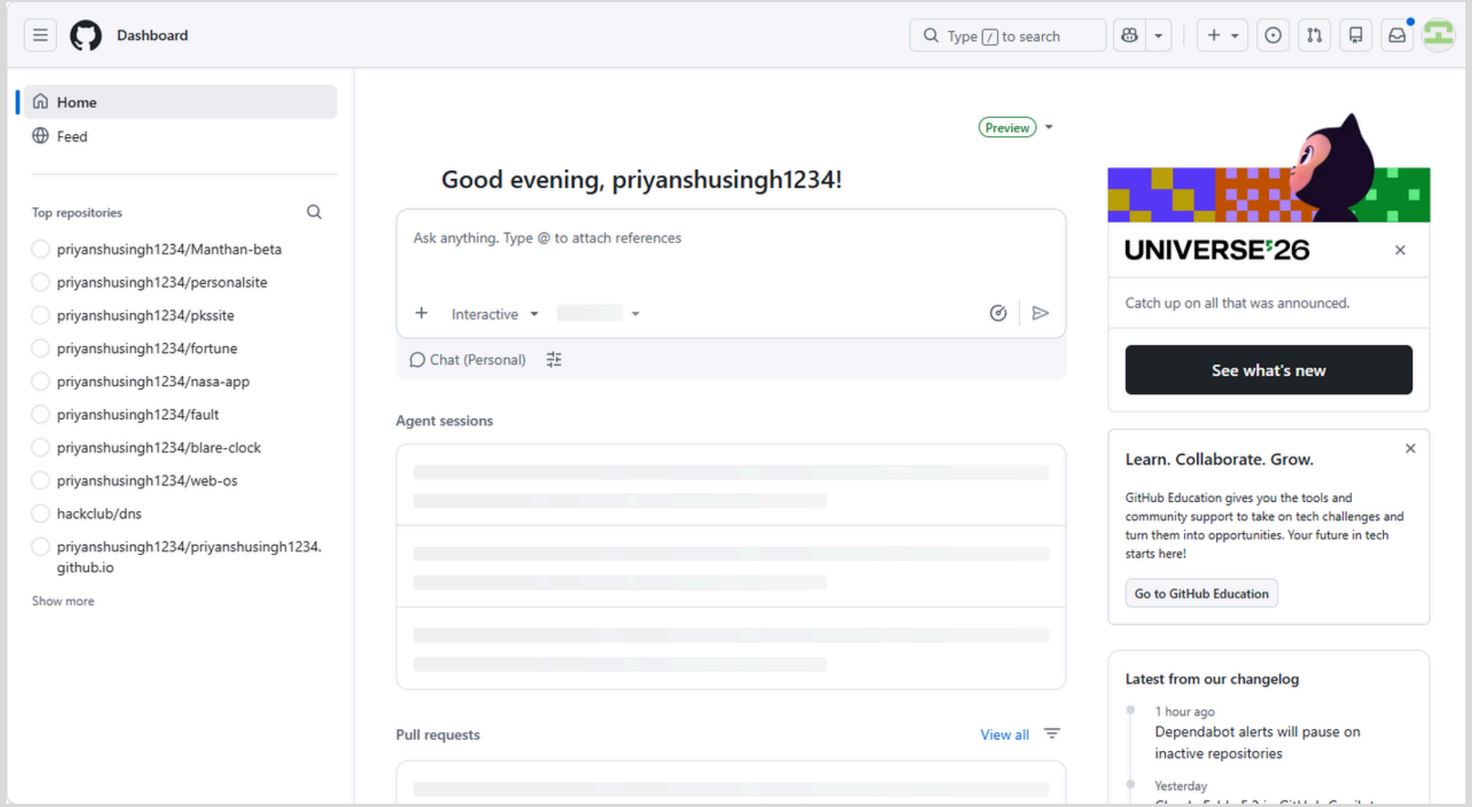

- **Setting up your repo — GitHub account, creating a repo, understanding folder structure**
- **Pushing your code — git add, git commit, git push — the holy trinity**
- **Deploying live — putting your site on the internet (Vercel / GitHub Pages)**
- **Building the clone — picking a social platform and copying its look with HTML & CSS**
- **Adding the cursed feature — the fun part. A button that runs away. Text that rotates upside down. A login form that fights back.**

The rule is simple:
It must look like you meant to do that.

What is GitHub?

Where your code lives forever (even the embarrassing stuff)

GitHub is like Google Drive — but for code. You save your project there, and anyone can see it, use it, or build on it.

But wait, what's Git?

Git	Github
.The tool on your computer	.The website that stores it
.Tracks every change you make	.Shows your history to the world
.Works offline	.Lives on the internet

Think of Git as your save button, and GitHub as your cloud backup.

Why do developers use it

- **History — go back in time if you break something**
- **Collaboration — multiple people, one project, no chaos**
- **Portfolio — your GitHub profile is your resume**
- **Deployment — connect to Vercel and your site goes live automatically**

The 3 commands you need to know:

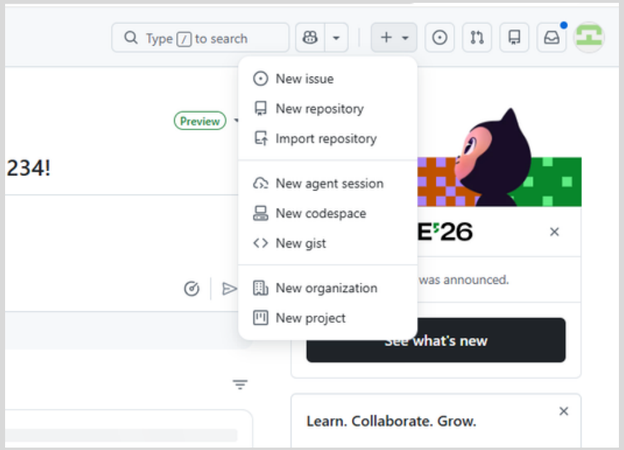

git add . "Hey git, track everything I changed"
git commit -m "msg" "Save a snapshot with a note"
git push "Upload it to GitHub"

Every professional developer uses Git every single day. Learning it now = you're already ahead.

Setting Up Your Repo

Step 1: Create a GitHub account

> Go to **github.com** → Sign Up → use your personal email Username tip: make it your name, you'll use this forever

Open any text editor (VS Code recommended) Create a folder with these files:

```
cursed-socials/
├── index.html    ← your main page
├── style.css     ← your styles
└── script.js     ← your cursed features
```

After the first push, you only need 3 commands every time: git add . → git commit -m "msg" → git push

```
git init
# start tracking this folder
git add .
# stage all files
git commit -m "first commit 🚀"
# save a snapshot
git branch -M main
# name the branch
git remote add origin <your-url>
# link to GitHub
git push -u origin main
# UPLOAD!
```

GitHub will show you these exact commands after you create the repo — just copy-paste!

Building the HTML Skeleton

Pick your social media target

Platform	Easy to clone?	Fun cursed ideas
Instagram	★ ★ ★ Easy	likes go *down* when clicked
Twitter/X	★ ★ ★ Easy	retweet button runs away
YouTube	★ ★ Medium	video plays upside down
TikTok	★ ★ Medium	scroll direction is reversed

Or invent your own wild cursed idea!

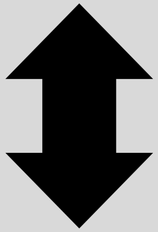

The bare minimum HTML

```html
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <meta name="viewport" content="width=device-width, initial-scale=1.0" />
  <title>CursedGram</title>
  <link rel="stylesheet" href="style.css" />
</head>
<body>

  <!-- NAVBAR -->
  <nav class="navbar">
    <h1 class="logo">CursedGram</h1>
    <button class="login-btn">Log In</button>
  </nav>

  <!-- FEED -->
  <main class="feed">
    <div class="post">
      <img src="photo.jpg" alt="post" />
      <p class="caption">this is a totally normal post</p>
      <button class="like-btn">♥ Like</button>
    </div>
  </main>
```

```html
  <script src="script.js"></script>
</body>
</html>
```

Add this to link javascript file.

You can use your own html to experiment and add more cool stuffs.

Basic CSS to make it look real

```css
body { font-family: sans-serif; background: #fafafa; margin: 0; }

.navbar {
  background: white;
  border-bottom: 1px solid #ddd;
  padding: 12px 24px;
  display: flex;
  justify-content: space-between;
  align-items: center;
}

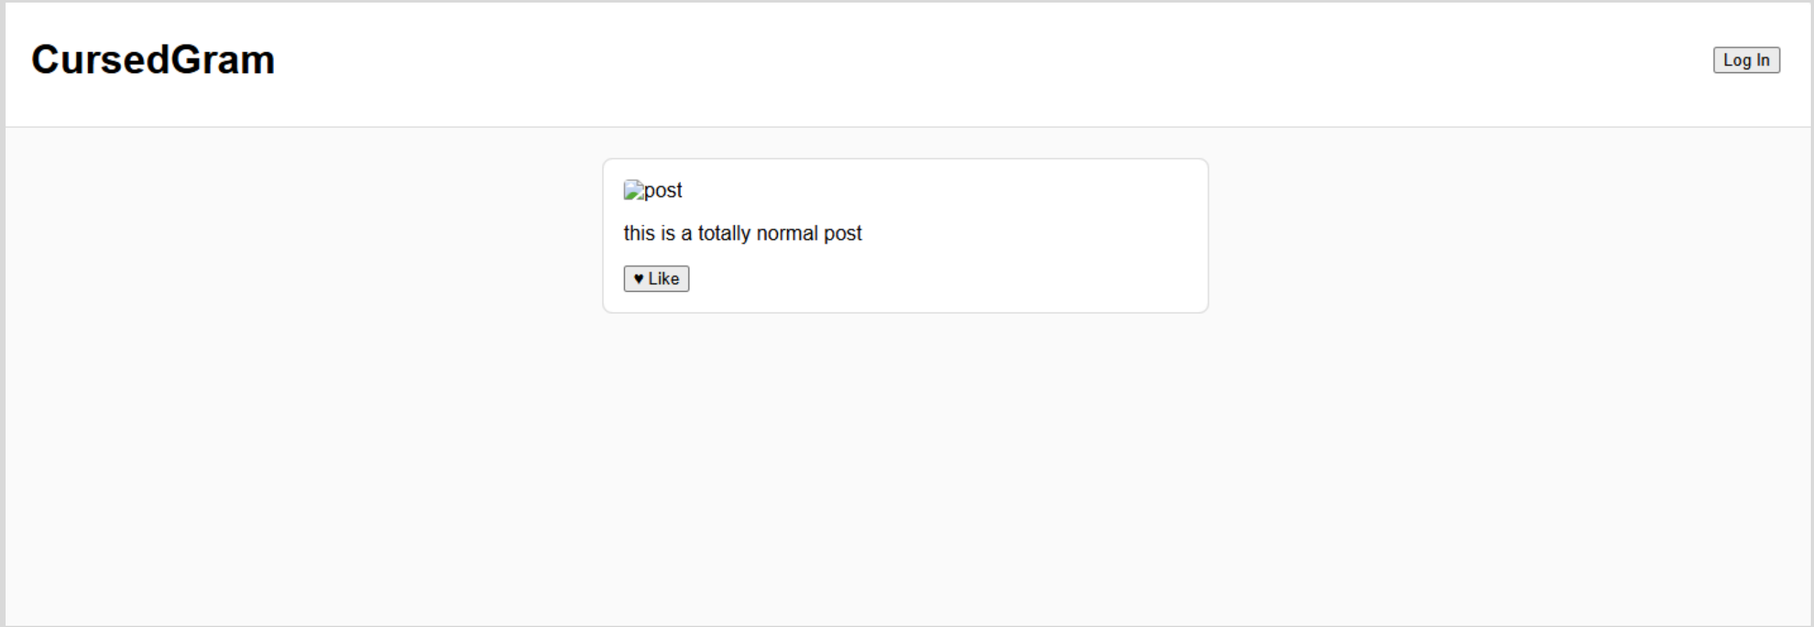

.feed { max-width: 480px; margin: 24px auto; }

.post {
  background: white;
  border: 1px solid #ddd;
  border-radius: 8px;
  padding: 16px;
  margin-bottom: 16px;
}

.post img { width: 100%; border-radius: 4px; }
```

Make sure to experiment with your own css skills and get that bonus point for css

A real-looking social feed. Nav bar. Posts. Like button. No cursedness yet — that's the next slide.

you can add real images to show in the web using CSS. In this we have not added any image that's why it looks broken.

Adding the Cursed Feature

It must look intentional. Not broken by accident — broken on purpose, with style.

The Like Button Goes Down

```
const likeBtn = document.querySelector('.like-
btn');
let likes = 100;

likeBtn.addEventListener('click', () => {
  likes--;  // goes DOWN instead of up 😈
  likeBtn.textContent = `♥ ${likes} Likes`;
});
```

#2: Button That Runs Away

```
const btn = document.querySelector('.login-
btn');

btn.addEventListener('mouseover', () => {
  const x = Math.random() * (window.innerWidth
- 100);
  const y = Math.random() *
(window.innerHeight - 50);
  btn.style.position = 'fixed';
  btn.style.left = x + 'px';
  btn.style.top = y + 'px';
});
```

#3: Page Flips Upside Down

```
document.addEventListener('keydown', (e) => {
  if (e.key === 'r') {
    document.body.style.transform =
      document.body.style.transform ===
'rotate(180deg)'
        ? '' : 'rotate(180deg)';
  }
});
```

#4: Infinite Scroll... Backwards

```
.feed {
  display: flex;
  flex-direction: column-reverse; /* posts
appear bottom-up */
}
```

Try these features and send screenshot in #Cursed-Socials in slack.

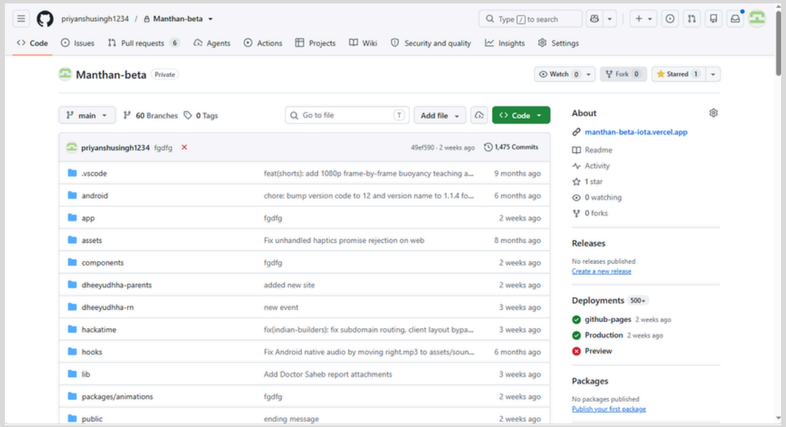

Pick ONE. Do it well. Explain why it's cursed in your README.

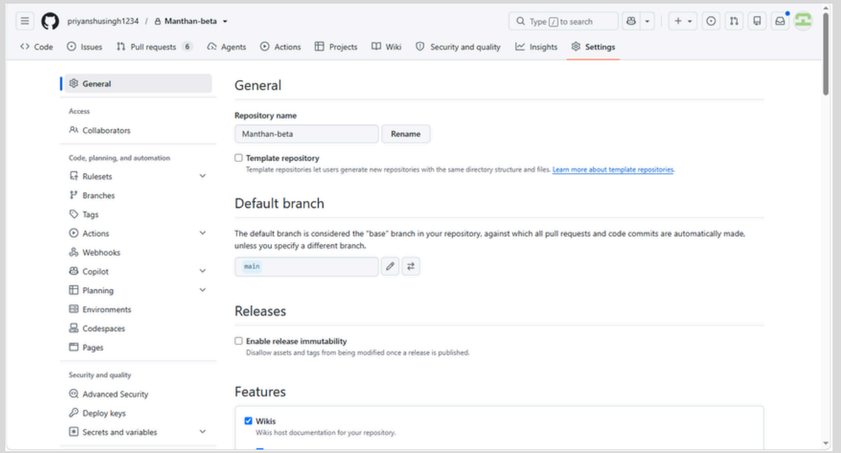

Deploying to the Internet

	GitHub Pages	Vercel
Best for	Pure HTML/CSS/JS	Any project
Speed	Medium	Very fast
Difficulty	★ Super easy	★★ Easy
Free?	Yes	Yes

Two options — pick one

Option A — GitHub Pages (Easiest)

Click save button and you are all done.

Option B — Vercel (Faster + Fancier)

Step 1: Go to vercel.com → Sign up with GitHub

Step 2: Click "Add New Project" → Import your GitHub repo

Step 3: Click Deploy (don't change any settings)

Your site is live at:

https://cursed-socials.vercel.app

After deploying — test it!

- Does the page load?
- Does your cursed feature work?
- Can you open it on your phone?
- Copy the link and share it — that's your submission URL

Every time you push new code:

```
git add .
git commit -m "made it more cursed"
git push
# → site updates in ~30 seconds automatically
```

make sure to run this.

That’s all for now ! If you have any doubt , feel free to ask in #Cursed-Socials channel.
